## Constraint Satisfaction Problem

ID: 1805028

**Overview: Constraint satisfaction problems (CSPs)** are mathematical questions defined as a set of objects whose state must satisfy a number of constraints or limitations. In this assignment, we have solved Latin Square Completion problem formatted as CSP. We have solved the problem using different criteria and thereby found the best possible way.

### Variable Order Heuristics:

VAH1: The variable chosen is the one with the smallest domain.

VAH2: The variable chosen is the one with the maximum degree to unassigned variables. Also, called max-forward-degree.

VAH3: The variable chosen by VAH1; Ties are broken by VAH2.

VAH4: The variable chosen is the one that minimizes the  $VAH1 / VAH2$ .

VAH5: A random unassigned variable is chosen.

### Value Order Heuristic:

Least Constraining Value First: Value that shrinks others' domain the least is taken first.

### Justification:

Firstly, if we consider random pick up, the domains are being shrunk almost randomly here with no predictability.

Secondly, let us consider hot takes. In hot takes, we take the most used values till now. But to implement that we would have to alter our algorithm by a fair amount.

Therefore, we decided on taking the Least Constraining Value next as it clearly gives us most flexibility . If we keep constraining our neighbors by assigning values that would shrink their domain the most, we surely would deviate from the solution by a big amount. Giving them the chance to keep the largest possible domain possible will result to us getting the solution early.

# Result:

| Problem | Solver | VAH  | #Node      | #BT        | Runtime |
|---------|--------|------|------------|------------|---------|

Graphical Representation:

**Observation:** In general, Forward Checking performs way better than Backtracking. Some of the Heuristics works better with FC and some with BT. Analyzing the tables and graphs, Forward checking with VAH3 is the best method.
